Difficulty

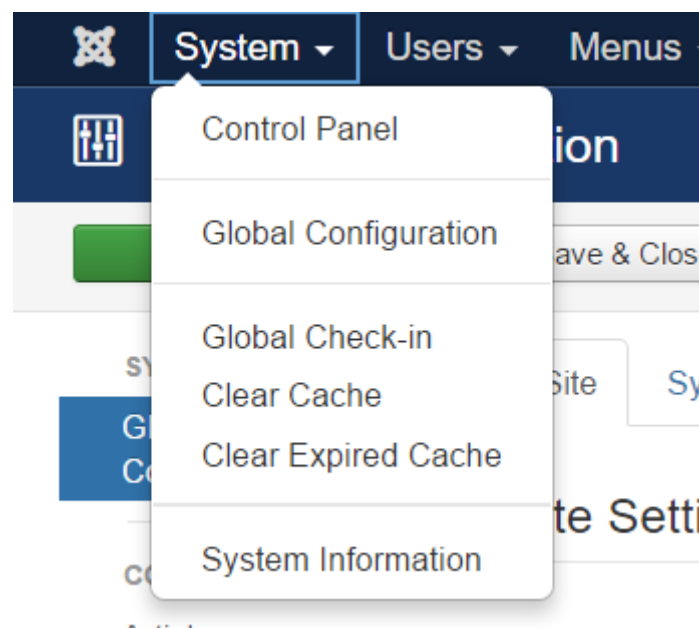

Very easy

Joomla Enable SEF

To enable SEO for your Joomla site:

- Login to administration (i.e. <https://domain.tld/administration>)
- In the top left click on System and then Global Configuration

- In the SEO Settings section enable “Search Engine Friendly URLs” & “Use URL Rewriting”

SEO Settings

Search Engine Friendly URLs	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Use URL Rewriting	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Adds Suffix to URL	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Unicode Aliases	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Include Site Name in Page Titles	<input type="text" value="Before"/>

- Enabling “Adds Suffix to URL” will add .html to most pages (this will depend on the MIME type), for example <https://domain.tld/index.html> or <https://domain.tld/index.php> (**Not Recommended**)
- Enabling “Unicode Aliases” will use the exact text in the alias of each object instead of using transliteration for non ANSI aliases. (**Not Recommended**)

Create .htaccess

You will need to create or modify .htaccess in your plan.

Command Line

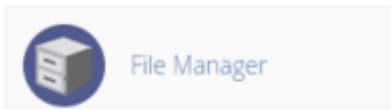

After you login:

```
cd public_html  
touch .htaccess  
cat htaccess.txt >> .htaccess
```

Please note that this will just append the contents of the default Joomla htaccess.txt to the current .htaccess if it exists or create a new one if it does not exist

cPanel

- Go to the File Manager

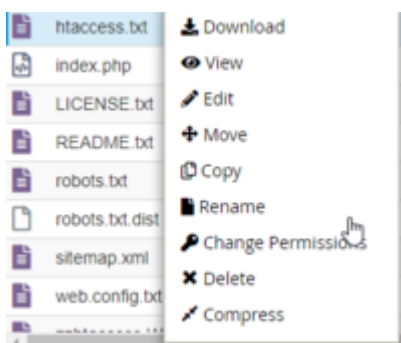

- Go to the public_html directory
- From the top right click on Settings

- On the Pop Up make sure the option **Show Hidden Files (dotfiles)** is Selected

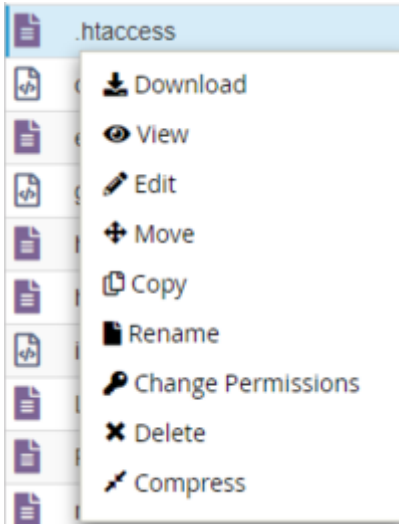

- Open the htaccess.txt file (Right Click → Edit → Edit) and select its contents **CTRL+A** and copy them **CTRL+C**

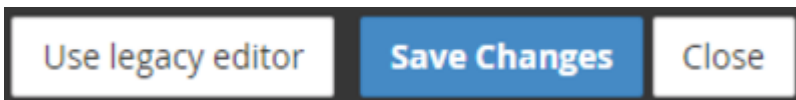

- Close the Editor from the top Right button (Close)

- Open the .htaccess file and paste the contents you copied in the end of the content in the file **CTRL+V**

- Click on Save Changes on the top right

This is the default htaccess for Joomla 3+

htaccess.txt

if you need it.
